.Scora

Trust Skills, Not Portfolios.

Business Model Canvas (BMC)

Commercial model and validation assumptions for Scora

Deliverable 03

Product: Scora **Team: Code Luck**
Phase: Product Validation & Strategy **Date: 27 July 2026**

Business Model Canvas

A one-page view of how Scora creates, delivers, and captures value during validation.

9 BUILDING BLOCKS / MVP HYPOTHESIS

Infrastructure · Value · Customer · Economics

8 Key partners

- Universities and bootcamps
- Developer communities
- Senior engineers and reviewers
- Cloud, sandbox, and AI providers
- Startup and recruitment partners

7 Key activities

- Design ownership gates
- Run secure code assessments
- Interview, live-change, and review
- Match verified talent to clients

6 Key resources

- Competency and rubric framework
- Challenge and benchmark bank
- Trust Engine and evidence data
- Reviewer network and infrastructure

2 Value propositions

- Verified pool without unsupported skill claims
- Proof of code ownership, not output alone
- Faster shortlist of maintainable developers
- AI-aware understanding and change gates
- Portable Passport with scope and recency
- Explainable evidence for every decision

4 Customer relationships

- Self-service assessment
- Guided feedback and onboarding
- Transparent appeals
- B2B client success

3 Channels

- Developer communities and GitHub
- LinkedIn and technical content
- Universities and incubators
- Partners, referrals, and Passports

1 Customer segments

- Startups and SMEs hiring freelancers
- Developers willing to prove ownership
- Hiring teams and agencies
- Later: education and enterprise teams

9 Cost structure

- AI and model evaluation
- Sandbox compute and storage
- Human review and support
- Engineering, security, and acquisition

5 Revenue streams

- Client subscriptions
- Reports and verified shortlists
- B2B assessment packages
- Premium reassessment and Passport

Commercial logic

Scora starts with a B2B-led model and free developer entry. Developers create supply and the portable trust asset; clients and hiring teams receive measurable value through reduced screening effort and lower mismatch risk.

Offer	Buyer	Starting price model	Validation question
Free verified profile	Developer	Free first baseline assessment within usage limits.	Will qualified developers complete the process and share the result?
Advanced reassessment	Developer	One-off fee or subscription for deeper tracks and refreshes.	Will feedback and career value justify payment without creating pay-to-win scoring?
Client access	Startup / SME	Monthly subscription for search, reports, filters, and shortlists.	Does Scora save enough screening time to justify recurring spend?
Custom assessment	Company	Per-candidate or package pricing.	Can role-specific assessment produce credible evidence at acceptable cost?
Verified shortlist	Company / agency	Per-shortlist or success-based fee.	Can Scora improve qualified interview and hire rates?

Unit economics to validate

- Assessment cost: AI tokens + sandbox compute + storage + support per completed attempt.
- Human-review rate: percentage of attempts escalated, minutes per review, and disagreement rate.
- Developer acquisition: cost per qualified profile, not merely account creation.
- Client acquisition: cost per activated buyer and payback period.
- Liquidity: verified developers per active skill-location band and client response rate.
- Retention: repeat client searches and developer reassessment / profile-sharing behavior.

Key business risks and mitigations

Risk	Why it matters	Initial mitigation
Score credibility	A weak or opaque score destroys the product's central promise.	Publish components, confidence, recency, limits, and version history; run calibration studies.
Chicken-and-egg marketplace	Clients need developers; developers need opportunities.	Start as verification + shareable passport, then add focused client discovery in one niche.
High review cost	Human review can overwhelm margins.	Escalate only high-value, anomalous, appealed, or low-confidence attempts.
Adverse incentives	Paid reassessment can look like pay-to-win.	Payment purchases an attempt or report depth, never a higher result.
Bias and accessibility	Language, disability, bandwidth, and background can distort results.	Multiple evidence modes, accommodations, audits, and an appeal process.
Data and IP concerns	Developers may submit proprietary code or clients may over-trust reports.	Use purpose-built challenges, strong retention rules, consent, and clear warranties/limits.

90-day validation sequence

1. Run 10-15 problem interviews across developers and SME clients; record decision criteria and failed-hire stories.
2. Test a report prototype before building the assessment engine; measure comprehension and ranking impact.
3. Pilot one role track with 30-50 developers and manual reviewer support behind the scenes.
4. Invite 5-10 clients to shortlist from verified profiles and compare against their normal process.
5. Measure completion, reviewer agreement, time-to-shortlist, contact rate, and willingness to pay.
6. Choose the next build only after identifying the strongest paying use case: subscription, custom assessment, or shortlist.
