

.Scora

Trust Skills, Not Portfolios.

Value Proposition Canvas (UVP)

Two-sided value design for verified developers and software buyers

Deliverable 02

Product: Scora Team: Code Luck

Phase: Product Validation & Strategy Date: 27 July 2026

Strategic positioning

Core value proposition

Scora creates a trusted freelance developer pool by verifying that every listed developer can explain, debug, modify, secure, and maintain the code they submit - including code produced with AI assistance.

The product does not reward a polished output alone and does not ban AI by default. It filters out unsupported skill claims: if a candidate cannot demonstrate ownership of the solution, that skill track is not verified and the candidate does not enter the verified discovery pool for that track.

Canvas A - Developer

Customer jobs	Pains	Gains
• Prove genuine ability beyond generated output. • Win relevant freelance opportunities. • Build credibility without long review history. • Demonstrate code ownership and engineering judgment. • Show responsible, review-driven use of AI.	• Cold-start disadvantage on reputation-led platforms. • Generated portfolios make real expertise harder to distinguish. • Generic tests do not reflect production engineering. • Output-only scoring rewards people who cannot maintain the code. • Assessments can feel opaque, stressful, or unfair.	• A portable profile that proves code ownership. • Evidence of explanation, debugging, review, and modification. • Fair discovery based on capability, not only history. • Visible growth through reassessment and recency. • Responsible AI use recognized without lowering the standard.
Products & services	Pain relievers	Gain creators
• Fundamentals and AI-allowed assessment modes. • Code-specific AI interview. • Live debugging and requirement-change tasks. • Technical report and Developer Passport.	• Understanding gates remove test-only false positives. • Explainable scoring with confidence and appeal path. • Role-relevant scenarios instead of puzzle-only tests. • Selective human review for uncertain results.	• Shareable proof for CVs and hiring platforms. • Verified access to the trusted developer pool. • Better matching to suitable project complexity. • Recognition of review, debugging, security, and maintenance.

Canvas B - Client / software buyer

Customer jobs	Pains	Gains
- Find a developer who fits the task. - Compare candidates consistently. - Reduce screening time and hiring risk. - Explain a hiring choice to stakeholders. - Avoid costly rework and fragile code.	- AI-generated portfolios and proposals are difficult to verify. - Non-technical buyers cannot assess architecture. - Senior engineers lose time on early screening. - Dependence becomes visible after work begins. - A working demo may hide weak ownership and security judgment.	- A shortlist restricted to verified ownership. - Plain-language evidence of strengths and limits. - Evidence from debugging, explanation, and live changes. - Reduced uncertainty before contracting. - Access to skilled developers without portfolio theater.
Products & services	Pain relievers	Gain creators
- Verified-only developer discovery. - Client-readable technical reports. - Skill and confidence filters. - Shortlists and optional custom assessments.	- Evidence tied to code-specific questioning and modification. - Failure to meet understanding gates blocks verification. - Human validation for high-stakes cases. - AI-use policy is explicit instead of guessed from detection.	- Comparable evidence cards across candidates. - Reduced early interview load. - Better fit by project type and complexity. - Audit trail showing why verification was granted.

UVP and differentiation

Audience	Scora message
Primary / client	Hire from a pool where developers must prove they understand and can own the code they deliver.
Developer	Prove you are an engineer who can direct, verify, and maintain AI-assisted work - not just generate it.
Short brand line	Trust Skills, Not Portfolios.

Differentiation pillars

Pillar	Meaning	Proof in product
Understanding gate	Output is never enough; ownership and judgment are required.	Code-specific explanation, hidden-bug debugging, live modification, and trade-off defense.
AI-aware verification	AI may be allowed, but dependence without understanding fails.	Separate fundamentals and AI-allowed modes plus declared tool-use policy.
Verified-only pool	Unsupported skill claims do not receive visibility as verified talent.	Track-level pass/fail gate before discovery, with appeal and reassessment.
Explainable trust	Scores show components, confidence, recency, and limits.	Clients can inspect evidence cards; developers can appeal or reassess.
Portable, current identity	Verification is useful beyond one application and expires with stale evidence.	Developer Passport, versioned assessments, reassessment history, and recency.

Critical assumptions and success measures

Outcome	Early metric	Why it matters
Developer value	Assessment start, completion, reassessment intent, report usefulness.	Tests whether the proof is worth the effort.
Client value	Time to shortlist, report comprehension, contact rate, qualified-hire rate.	Tests whether evidence improves a real decision.
Trust quality	Score stability, reviewer agreement, appeal overturn rate, false-flag rate.	Tests whether the mechanism is reliable and fair.
Marketplace health	New-developer discovery, response equality, repeat hiring.	Tests whether Scora reduces rather than recreates reputation lock-in.
